

FoodChain™

Warehouse Management

Cedar Creek
COMPANY

Cedar Creek Company's Enterprise, Plant and Warehouse Inventory Modules - are fully scalable and provide inventory and distribution functions in real-time. This CCC module provides traceability of cartons and carcasses from point of packing to point of load out.

The system includes all functions required to record and track products by item and by location. It can also report on the age, value and exact location of each item - down to 7 levels in a warehouse (such as zone, section, aisle, bay and shelf position). Business rules can be set around where products may be stored in relation other products and storage heights. Put-away rules can be defined and prescribed. Instructions for paperless picking (for example, the oldest first) can be assigned. Stock-taking is rigorous with alerts set up for any stock already included in other transactions.

Each individual inventory transaction (from scanned data to manual entry) is identified by a unique number plus a transaction type. These transaction types are date and time stamped and

cover all steps from creation to completion - including stock movements, load outs and transfers. Once a transaction is 'completed' it cannot be changed, and time stamps cannot be altered by users. However, the transactions may be reversed, copied to form a new transaction or deleted.

The individual particularities for each transaction are captured within this software module and can be drawn down for reporting. This information is available through an online system, so inventory locations and transactions can be monitored from any computer. This module can integrate with on-floor and back-office systems and can automate the processing and output of documentation required for orders when they leave site.

These inventory modules integrate with a wide range of financial systems and third-party warehousing stock programs.
